

Mitigating Extremely Slow Corner Cases in the GNU Math Libraries on TLCC2 and BG/Q

LC User's Meeting

Nov 13, 2014

John Gyllenhaal, Livermore Computing

National Laboratory

LLNL-PRES-665014

This work was performed under the auspices of the U.S. Department of Energy by Lawrence Livermore National Laboratory under contract DE-AC52-07NA27344. Lawrence Livermore National Security, LLC

In ~2008 the GNU math library decided to sacrifice performance for accuracy

- Drops into 768 bit emulation mode for some inputs
 - For BG/Q (Seq) `bgxlc -O3 -qstrict` or `bgxlc -O2` or `bggcc -O3`
 - `pow (0.999999999999999998L, 1.5)` -> 898 cycles
 - `pow (0.999999999999999999L, 1.5)` -> 8,675,748 cycles
 - `exp (0.111E-15L)` -> 374 cycles
 - `exp (0.11102230246E-15L)` -> 1,675,327 cycles
 - Hits TLCC2 (Zin) also for gcc (all optimization levels)
 - `pow (0.999999999999999997L, 1.5)` -> 1,127,464 cycles
 - `exp (0.11102230246E-15L)` -> 203,397 cycles
- Recently caused unexplained 4X slowdown on BG/Q
- Diagnostic: STAT & profiling shows descriptive names
 - `__slowexp`, `__slowpow`, `__mpexp` (called by `slowexp` & `slowpow`)

Mitigation Strategy: Don't Use GNU Math Library!

- On TLCC2 (Zin) with gcc, link to Intel's Math Libraries
 - `-L/usr/local/tools/ic-14.0.174/lib -Wl,-rpath,/usr/local/tools/ic-14.0.174/lib -limf -lintlc`
 - Automatic for Intel Compilers (why we haven't seen much)
 - However gives slightly different answers for these corner cases
- On BG/Q (Seq) link to IBM's MASS Library
 - `-L/opt/ibmcmp/xlmass/bg/7.3/bglib64 -lmass`
 - Automatically inlined for IBM Compilers with `-O3` **if don't specify `-qstrict`**
 - Slight differences in accuracy possible for 'exceptional' values
- Surprisingly tricky to get link line right
 - Must be placed just before first `-lm` or `-lxlmath`
 - Must be placed after everything else (.o files, etc.)
- Link line check for library that provided exp
 - `-Wl,-y,exp` -> want exp found first in libimf or libmass
 - I can help -> gyllen@llnl.gov, 4-5485
