TOSS 3 Development Environment

LC User Meeting

March 1, 2016

Gregory Lee, LC Development Environment Group
What to expect in this talk
AKA, don’t shoot the messenger

- This talk focuses on software currently in /usr/local
- We are still working out details
- We would like your feedback
What and why?

- CTS-1 and TOSS 3 are coming!
- Packaging software will be changing (from Debian -> Koji + Spack)
- We would like a more consistent tri-lab compute environment
There are many changes coming.

- Adding `/usr/tce`

- Restart from "scratch" (not all SW versions in TOSS 2 will appear in TOSS 3)
  - Intel compiler example
    - some major versions will probably be deprecated (i.e. version 9)
    - only 1 <major>.<minor> for older versions (i.e., 13.0, 13.1, 14.0, 15.0 instead of 19 currently installed)

- What are “defaults”?

- Migrating from dotkits to Lua-based modules
Tri-lab collaboration will improve cross-lab compatibility

- Some packages will still be site-specific
- What is installed will be site specific
- ... but, many packages will be ready on demand at other sites
What do you think?

- We would like your feedback!
